TECHNICAL DEVELOPMENTS

BULLETIN #6

March 24, 1980

INSTALLATION AND ATTACHMENT OF LAYERS OF INSULATION

1. Wherever total insulation thickness permits, it is desirable that all insulation be installed in two layers, with the joints in each layer offset so as not to present a vertically continuous joint through the total insulation thickness.
2. When two layers of insulation are installed on metal roof decks it is preferred that the first layer be installed by mechanical fastening.
3. It is recommended that the second layer of insulation be embedded into hot bitumen (not mechanically fastened).
